5 ABSTRACT OF THE DISCLOSURE

6 Players participate in bingo-type games through player stations each having a suitable
7 player interface. Once a player is assigned a bingo card representation and a game designation
8 set is associated with the bingo card representation, daubing the bingo card representation may be
9 performed manually by the player at the player's respective player station using a suitable
10 interface at the player station. Alternatively to manual daubing, the present invention includes
11 automatically daubing one or more bingo card representations in response to an automatic daub
12 input made by the player at the player station using a suitable input device.
